

Special invitation to LYREC members

All-expense-paid conferences

Each year, Lower Yellowstone Rural Electric Cooperative sponsors members and/or a member couple to attend the Today's Members Program in Great Falls at the Heritage Inn. This program is held in conjunction with the Montana Electric Cooperatives' Association (MECA) annual meeting.

The Today's Members Program is an educational opportunity for members to learn about the history, operations and some of the issues that affect cooperative members along with the future of electric cooperatives. If you choose to attend, it requires a three-day commitment.

Lower Yellowstone Electric will pay for the conference fees, hotel room, meals and mileage to the meeting.

This program is an important piece of what electric cooperatives are about – educating their members. If you are interested in learning more about cooperatives and are able to attend during this time, complete the registration form provided below this article.

This year, registration begins at 10 a.m. Tuesday, Sept. 27, and the meeting will conclude mid-morning Sept. 29. If you are interested in attending, please complete the form below or call Jami. ■

ENTRY FORM FOR TODAY'S MEMBERS PROGRAM

(Participants must be members of Lower Yellowstone Electric to be eligible.)

Member's name (as it appears on your bill)

The differences between overhead and underground power lines

BY TOM TATE

There are two methods of installing the power lines that carry electricity to your home – overhead and underground. Lower Yellowstone Rural Electric Cooperative’s members sometimes ask why the cooperative uses one versus the other, or even why all power lines are not installed using the underground construction method. Isn’t one method better than the other? These are great questions, and the answer is that each method has its place.

Overhead line construction starts with the setting of utility poles. Poles can be set in nearly any type of terrain, even rocky. In the case of heavy rock, special equipment is used to augur out the hole. If placement occurs in boggy or wet terrain, many techniques are available to set poles securely. Once the poles are in place, wires can be strung and then equipment – like transformers, fuses and reclosers – are installed. Power can now flow.

Underground line construction requires digging a trench that is deep enough to keep the lines well away from surface activities. Where the terrain is extremely rocky, underground lines may not be an option. Next, wires are laid in the trench directly or placed in conduits for protection. The trench is filled, and the surface is restored to its original condition. Padmount transformers and additional equipment are installed as needed, and the system is ready to deliver electricity.

Determining if power lines should be overhead or underground boils down to what is best for the situation. Underground lines might be ideal in situations where there is a desire to keep the poles and wires out of sight, such as a residential neighborhood, park or historical area. There are many cities and towns that construct only underground lines for a variety of reasons.

Overhead systems work well when appearance is not a major concern. Examples include extremely long line distances across country, where the voltages are higher than the limitations set for underground lines.

The ultimate mix of underground and overhead construction used by Lower Yellowstone Electric provides you, our members, with the highest possible quality of service at the lowest possible price. Cost, appearance, reliability, maintenance and future upgrades will drive which is the better approach – overhead or underground. ■

OVERHEAD & UNDERGROUND
POWER LINES
THE PROS AND CONS

OVERHEAD

PROS

- Lower cost
- Quicker construction
- Easier to spot damage and faults
- Less expensive to repair and upgrade
- Can be built in any terrain
- Any voltage can be placed overhead

CONS

- Susceptible to wind, ice and snow
- More vulnerable to damage from trees and vegetation, which requires right of way trimming
- Vulnerable to blinks when animals and branches contact lines
- Susceptible to damage from vehicle collisions
- Less attractive

Photo: Aster Pelikan

UNDERGROUND

PROS

- Not vulnerable to damage from tree branches
- Does not interfere with views
- No right of way (tree trimming) required
- Less susceptible to damage from vehicle collisions
- Not impacted by wind, ice and snow
- Less vulnerable to blinks when animals and branches contact lines

CONS

- More expensive to build
- Susceptible to flooding
- Difficult to locate faults
- Expensive to repair
- Fed by overhead lines at some point, making the lines vulnerable to outages and interruptions
- Limitations on voltages that can be buried underground
- Can be vulnerable to dig-ins

SmartHub allows online payments

SmartHub is Lower Yellowstone Rural Electric Cooperative's (LYREC) official online payment service. You can access SmartHub through the cooperative's website at www.lyrec.com or through the SmartHub mobile app, available for Apple and Android devices. You can either make a one-time payment or sign up for recurring payments. There are no additional fees to use this service. Payments made through SmartHub are secure and are reflected on your account immediately.

Pay Now

Pay Now is another online payment option. You must access Pay Now through the cooperative's website via computer. The only information you will need when using Pay Now is the account number and the last name on the account. Pay Now is quick and easy to access.

IVR system

The IVR system allows members to inquire and make payments on their electric account 24 hours a day, seven days a week via phone. A one-time payment can be made by credit/debit card, or electronic check. Members may also set up recurring credit card payments through the IVR system. To make a payment, have your account number ready. Another way you may be able to look up your account is with your phone number. However, if LYREC does not have the correct phone number on file, you will have to use your account number. Dial 844-209-7159 to make a payment.

Lower Yellowstone Electric is excited to offer this software to our membership. It will allow our members to get current and valuable account information at their fingertips. LYREC can no longer take payment information over the phone. If you have questions, please call our office. ■

WEATHER STRIPPING DOORS

Capturing Energy Savings by Sealing Air Leaks

Save energy and seal air leaks by weather stripping exterior doors. How do you know if you need to weather strip? If you can see any amount of light between the door frame and the floor, weather stripping should be applied to eliminate energy waste. This DIY energy-saving project is relatively easy and inexpensive depending on the type of materials selected. The most common weather stripping material is self-adhesive foam strips, although rubber, vinyl, metal, or a combination of materials may also be used.

1 CLEANING SURFACES - Clean the door and door jamb to be weather stripped. For best results, weather stripping should be applied to clean, dry surfaces above 20°F.

2 MEASURING DOOR & DOOR JAMBS - To ensure greater accuracy, measure your space twice before cutting the material. It is best to plan for one continuous strip for each side of the door and door jamb.

3 CUTTING FOAM - Cut long pieces of self-adhesive weather stripping material (foam, vinyl, etc.) for each side of the door jamb and door.

4 APPLYING WEATHER STRIPPING - Peel back the self-adhesive foam. Apply one continuous strip of material snugly along each side. Make sure the weather stripping meets tightly at the corners and is pressed firmly onto the door and door jamb. The material should compress tightly between the door and door jamb, without making it difficult to shut.
